Why should you care about the RENNES 17.11.2022 model theory of valued fields

The plan today:

- what is model theory (nopefully)
- the analogy between Q_p and H_p (It) (in algebra)
- what model theorist can say about this analogy

we will really move back-and-forth between the two first points, hopefully motivating the first through the second.

what is model theory?

The goal of model theory in tacking mathematical structures in a formal way, i.e. properties that can be expressed by a formula in a formal Language.

Our guiding example the language of ringry,

$$\mathcal{L} = \{ +, \cdot, -, 0, 1 \}$$

$$function \qquad Constant$$

$$symbols \qquad Symbols \ Symbols \$$

where *L*-formulae are built in this way. start with

$$p(X_1, ..., X_n) = Q(Y_1, ..., Y_m)$$

 $polynomials over 7L$

and then recursively use connectives:

- negation (7) ~~ 7 ($p(X_{1_1}...X_n)=0$) means $p(X_{1_1}...X_n) \neq 0$,
- conjunction (1) & disjunction (V),
- implication (\neg) ,
- quantifiers $(\Psi, \exists) \rightarrow \forall X, Y(X^2 Y = 0), \exists z_1, ... z_n(Q(z) \neq 0).$

Some examples:
$$\forall X (x \neq 0 \rightarrow \exists Y (x = Y^2))$$

 $\exists X (x^2 + 1 = 0)$

Both of these examples are *L*-sentences, i.e. all variables that occur are quantified:

$$\forall X (X \neq 0 \rightarrow \exists Y (X = Y^{z})).$$

These are the formulae that make sense in a structure:

$$\exists Y (X = Y^2)$$

is this true? It depends on the choice of X! Let's focus on sentences, then we then need to formalize the idea of "being the": *L-structures*.

We give meaning to a sentence in an *L*-structure via these choices of interpretations. We will use =.

Some examples:

$$R \models \forall X (X \neq 0 \rightarrow \exists Y (X = Y^{5}))$$

$$\land we mean (R_{+}, -, 0, 1)$$

$$R \not\models \exists X (X^{2} + 1 = 0)$$

$$\land "false"$$

$$C \models \exists X (X^{2} + 1 = 0)$$

$$\land we mean (C_{+}, -, 0, 1)$$

$$R_{exp} \models \forall X, Y (exp(X + Y) = exp(X) \cdot exp(Y))$$

$$\land m \text{ an expanded vanguage } \land v \{exp\}$$

$$R \models \forall X (0 \leq X \rightarrow \exists Y (X = Y^{2}))$$

$$\land m \text{ an expanded language } \land v \{ \leq \}$$

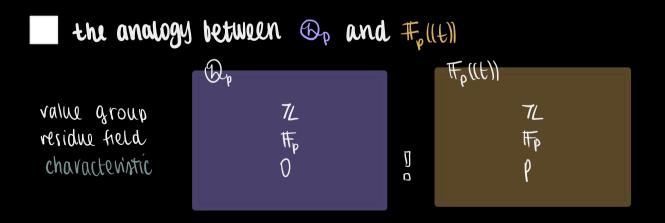

Given a structure M in some language L',

$$Th(M) = \{ \mathcal{P} \ L' - senten \mathcal{Q} \in M \models \mathcal{P} \}.$$

Rephrasing the goal: understand M in terms of Th(M). As an example, we will book at

 $Th(\mathbb{Q}_p) \stackrel{\swarrow}{\stackrel{\sim}{\underset{\scriptstyle}{\overset{\scriptstyle}{\overset{\scriptstyle}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}\tilde{}}{\overset{\scriptstyle}}{}\tilde}{\overset{\scriptstyle}}{}}{\overset{\scriptstyle}}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}}{\overset{\scriptstyle}}}{}\overset{\scriptstyle}}{}\tilde}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{\overset{\scriptstyle}}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}}{}\overset{\scriptstyle}}{}\overset{}}}{}\tilde}{}\overset{\scriptstyle}}}{}\tilde}{}\tilde}{}\tilde}\tilde}{}\tilde}{}\tilde}{}\overset{\scriptstyle}}}{}}{}\overset{\scriptstyle}}{}\tilde}$

both in the language L.

This last line tells us something: even for \mathcal{L}_{i}

However, they "Look" very similar:

$$\mathfrak{D}_{p} = \left\{ \sum_{n \geq N}^{\infty} a_{n} p^{n} \mid N \in \mathcal{I}_{L}, a_{n} \in \{0, 1, \dots, p-1\} \right\},$$

$$|\mathbb{F}_{p}((t)) = \left\{ \sum_{n \geq N}^{\infty} a_{n} t^{n} \mid a_{n} \in \mathbb{F}_{p}, N \in \mathcal{I}_{L} \right\}.$$

Indeed, up to moving to mome expansion,

Theorem. (Fontaine – Winterberger)

Gal
$$(\mathbb{Q}_p(p^{\prime}p^{\infty})) \simeq \operatorname{Gal}(\mathbb{T}_p(\mathfrak{lt})) (\mathfrak{t}^{\prime}p^{\infty})).$$

(This is really a consequence of $Gal(K) \simeq Gal(K^{\flat})$).

We need to tors in all those p-th roots. Indeed, Gal(\mathfrak{O}_p) & Gal(\mathfrak{F}_p (Lt))). One can actually prove that Gal(K) ~ Gal(\mathfrak{O}_p) if and only if $Th(\mathfrak{O}_p) = Th(K)$. A as topological groups

The model-theoretical Content of FW has been recently explored by Fuhnke & Kartar, using a narder version of the next theorem.

what can model theory say?

THEOREM. (Ax-Kochen / Eršov, 160x) Given a sentence 4 in the language \mathcal{L} , there is a natural number $N = N(\mathcal{L}) \in \mathbb{N}$ such that, for all p = N, $\mathcal{L} \in Th(\mathbb{Q}_p) \iff \mathcal{L} \in Th(\mathbb{F}_p(\mathbb{I} + \mathbb{I})).$

In other words, the two theories are asymptotically the same ("p -> as makes p transcendental").

Let's see a concrete example: Ci field. Ci-fields arise as generalizations of algebraically clusted fields:

> Ci(d) - homogeneous polynomials of degree d in N7 di variables have non-trivial roots

Then C_i means $C_i(d)$ for all $d \in IN$. For example, finite fields are C_1 (note that C_1 pust areas for N > d). Complete aiscretely valued fields with begebraically closed residue field are C_1 (e.g. the fraction field of $W \in \mathbb{F}_p^{a \ge 0}$] 1.

Artin, Qp is C2. ~> false, by Terjanian. However,

COPOLLARY. There exists $\overline{p} = \overline{p}(d)$ such that, for all $p \gg \overline{p}$, \mathbb{Q}_p is $C_2(d)$.

This in a corollary of AKIE because

- · being Cz(d) is a sentence ofd,
- · Fp(1+1) is C2 (this was proved by Lang).

what is model theory really saying?

The AKIE principle is really much deeper: what is the for a large class of valued fields is that

 $T_h(K_V) = T_h(L_W) \iff T_h(k) = T_h(L) & T_h(\Gamma_K) = T_h(\Gamma_L)$ (expended language) residue fields value groups
